SKILLS

Backend: Node.js, NestJS, Express.js, TypeScript, REST APIs, Microservices, API Gateway

Databases: MongoDB, PostgreSQL, Redis, MySQL

Frontend: React, Next.js, Electron, Tailwind CSS

Cloud : AWS (EC2, S3, RDS, Lambda Serverless, SQS, SES, Cloudwatch), GCP

EXPERIENCE

Software Developer

Netpair Infotech

Dec 2022 – Present

Ahmedabad, Gujarat

- Developed and maintained scalable web applications using TypeScript, NestJS, Next.js, and ReactJS.
 - Designed RESTful APIs and implemented integration with MongoDB and PostgreSQL databases.
 - Managed cloud infrastructure, deployment, and maintenance of services using AWS EC2, S3, and RDS.
- system performance and scalability by optimizing backend services and database queries

PROJECTS

Qbit CMS - IoT Device Management Platform

Tech Stack: TypeScript, NestJS, MongoDB, Next.js

- Designed and developed backend services for real-time monitoring and remote control of IoT-enabled street light devices.
- Implemented high-frequency telemetry ingestion APIs with validation and handling for duplicate or delayed device payloads.
- Built server-side alarm evaluation logic for power failures, communication loss, and threshold breaches.
- Developed two-way communication APIs for issuing device control commands with execution tracking and acknowledgment handling.
- Implemented scheduling logic for time-based device operations at scale.
- Enforced role-based access control using NestJS guards for multi-tenant administrative workflows.
- Optimized MongoDB schemas and indexes for efficient querying of recent and historical device data.

Neutron – Healthcare Coordination Platform

Tech Stack: TypeScript, React, Express.js, MongoDB

- Built backend workflows for a healthcare intermediary platform connecting insurers, corporates, and diagnostic service providers.
- Implemented appointment lifecycle management across multiple role-based portals. .
- Developed secure medical document processing pipelines including ID proof attachment, image handling, face-match snapshot generation, PDF stamping, and document merging.
- Ensured all document processing was handled server-side to meet security and auditability requirements.
- Designed and enforced role-based access control for five distinct portals.
- Architected data segregation using isolated MongoDB databases to separate sensitive medical data from operational workflows.
- Added centralized validation, error handling, and logging for healthcare-grade reliability.

Oopchar – Multi-Tenant Healthcare Platform (Freelance)

Tech Stack: TypeScript, Node.js, Express.js, MongoDB, PostgreSQL

- Served as the sole backend developer for a multi-tenant healthcare platform supporting patients, clinics, hospitals, laboratories, and staff.
- Designed and implemented a microservices architecture with seven backend services and a centralized API Gateway.
- Implemented JWT-based authentication with tenant and clinic isolation enforced at the backend level.
- Built dynamic appointment scheduling with safeguards to prevent overbooking and concurrent booking conflicts.
- Used PostgreSQL transactions to ensure consistency across appointments, clinical interactions, invoicing, and billing workflows.
- Managed clinical data workflows including vitals, prescriptions, lab investigations, growth charts, and visit summaries.
- Implemented audit logging across all APIs with soft-delete strategies to preserve medical history.

Xcare – Healthcare Platform (Freelance, Live System)

Tech Stack: TypeScript, Node.js, Electron, React, Twilio, Google Calendar APIs

- Developed backend services and a desktop application for a live healthcare product used by clinics
- Implemented a secure auto-update mechanism for the Electron desktop app using backend-controlled GitHub releases.
- Built a two-way communication system using Twilio Conversations, enabling clinics to chat via desktop while patients receive SMS messages.
- Designed and implemented usage-based SMS billing per clinic from backend message logs.
- Integrated Google Calendar using OAuth, creating provider-level calendars and mapping them to system users.
- Implemented bi-directional calendar synchronization to block appointment slots based on external calendar events.

DMMS – Asset Management System

Tech Stack: TypeScript, Next.js, MongoDB

- Designed and developed a full-stack asset management system to track assets, maintenance schedules, warranties, and lifecycle events.
- Implemented backend APIs for asset creation, assignment, maintenance, and retirement workflows.
- Built role-based access control and multi-site data segregation for asset operations.
- Implemented custom approval workflows for sensitive asset actions at the backend level.
- Designed flexible MongoDB schemas to support multiple asset types and evolving requirements.

EDUCATION

BE Computer Science Engineering
Government Engineering College, Modasa

CGPA 7.51
Jun 2018 - May 2022
